A recipe for finding lines of best fit

$$y = mx + c$$

$$y = mx$$

Summary: Line of Best Fit for: y = mx + c

$$y = mx + c$$

$$\overline{x} = \frac{1}{N} \sum_{i=1}^{N} x_i, \quad y = \frac{1}{N} \sum_{i=1}^{N} y_i, \quad \overline{x^2} = \frac{1}{N} \sum_{i=1}^{N} x_i^2, \quad \overline{y^2} = \frac{1}{N} \sum_{i=1}^{N} y_i^2, \quad \overline{xy} = \frac{1}{N} \sum_{i=1}^{N} x_i y_i$$

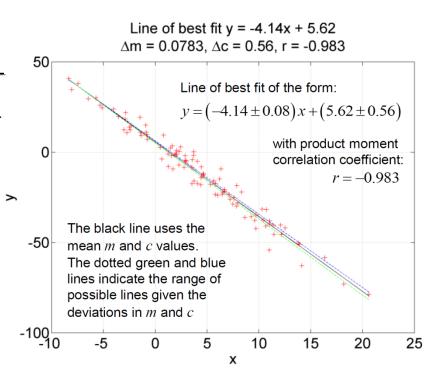

$$V[x] = \overline{x^2} - \overline{x}^2$$
, $V[y] = \overline{y^2} - \overline{y}$, $cov[x, y] = \overline{xy} - \overline{xy}$

$$m = \frac{xy - \overline{yx}}{\overline{x^2} - \overline{x}^2} = \frac{\text{cov}[x, y]}{V[x]}, \quad c = \overline{y} - m\overline{x}$$

$$r = \frac{\text{cov}[x, y]}{\sqrt{V[x]V[y]}}$$

$$\Delta m = \frac{s}{\sqrt{N}} \frac{1}{\sqrt{V[x]}}, \quad \Delta c = \frac{s}{\sqrt{N}} \sqrt{1 + \frac{\overline{x}^2}{V[x]}}$$

$$s = \sqrt{\frac{1}{N-2} \sum_{i=1}^{N} (y_i - mx_i - c)^2}$$

Summary: Line of Best Fit for:

$$y = mx$$

$$\overline{x} = \frac{1}{N} \sum_{i=1}^{N} x_i, \quad y = \frac{1}{N} \sum_{i=1}^{N} y_i, \quad \overline{x^2} = \frac{1}{N} \sum_{i=1}^{N} x_i^2, \quad \overline{y^2} = \frac{1}{N} \sum_{i=1}^{N} y_i^2, \quad \overline{xy} = \frac{1}{N} \sum_{i=1}^{N} x_i y_i$$

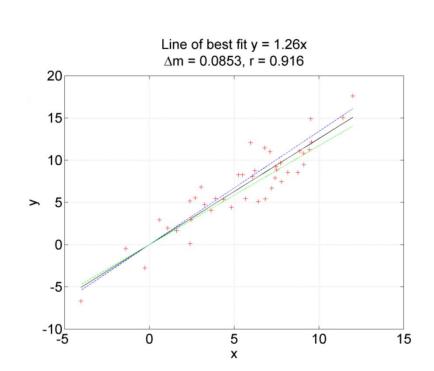

$$V[x] = \overline{x^2} - \overline{x}^2$$
, $V[y] = \overline{y^2} - \overline{y}$, $cov[x, y] = \overline{xy} - \overline{xy}$

$$m = \frac{xy}{x^2}$$

$$r = \frac{\text{cov}[x, y]}{\sqrt{V[x]V[y]}}$$

$$\Delta m = \frac{s}{\sqrt{N}} \frac{1}{\sqrt{V[x]}}$$

$$s = \sqrt{\frac{1}{N-1} \sum_{i=1}^{N} (y_i - mx_i)^2}$$

Correlation & Linear Regression

Х

Perhaps the most important analytical tool in the physical sciences is the ability to quantify the validity of a model relating a set of measurable parameters. The idea is as follows:

- (1) Rearrange the model in such a way that it becomes a *linear equation* of the form y = mx + c
- (2) Plot experimental (x,y) data on a graph and determine the **line of best fit** through the data.
- (3) Determine *gradient m* and *vertical intercept c* from the line of best fit.
- (4) Determine the standard deviation of both gradient m and intercept c, and a quantitative measure of how good the fit is (this is called the **product moment correlation coefficient**).

To determine the line of best fit*, let us sum the *squared* deviations of (x,y) from the line of best fit.

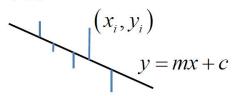

Line of best fit
$$y = -4.14x + 5.62$$

$$\Delta m = 0.0783, \ \Delta c = 0.56, \ r = -0.983$$
Line of best fit of the form:
$$y = (-4.14 \pm 0.08)x + (5.62 \pm 0.56)$$
with product moment correlation coefficient:
$$r = -0.983$$
The black line uses the mean m and c values. Which pairing results in the $minimum$ value of S ?

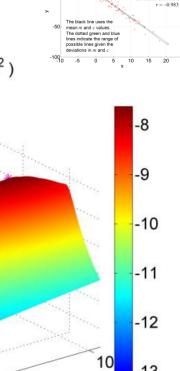

The dotted green and blue lines indicate the range of possible lines given the deviations in m and c

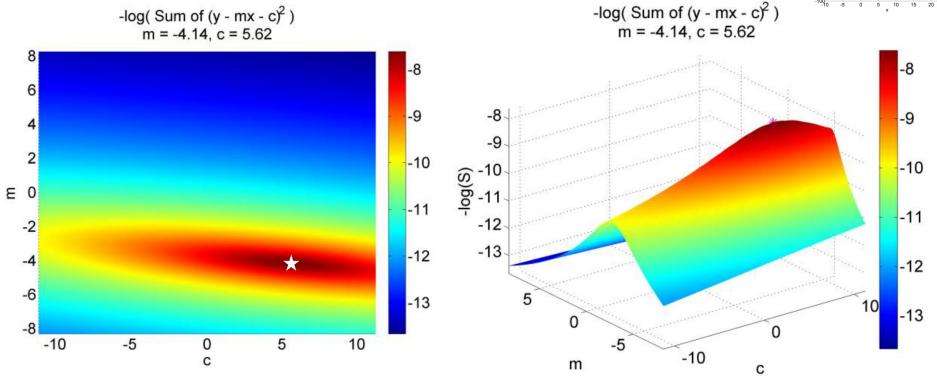

To determine the line of best fit*, let us sum the *squared* deviations of (x,y) from the line of best fit.

$$S = \sum_{i=1}^{N} (y_i - mx_i - c)^2$$

Using the (negatively correlated) data on the right, we can plot a surface of S vs m and c values We can see this has a **minimum** at a particular (m,c) coordinate. (Note for clarity the plots below are of $-\log S$, so the (m,c) coordinate corresponds to the peak, i.e. maximum, instead).

The minimum of S can be found by differentiating S with respect to m and c, and setting these expressions equal to zero. Since S is a function of two variables we must use *partial derivatives*.

$$S = \sum_{i=1}^{N} (y_i - mx_i - c)^2$$

$$S = \sum_{i=1}^{N} (y_i - mx_i - c)^2$$

$$\frac{\partial S}{\partial m} = 2 \sum_{i=1}^{N} (y_i - mx_i - c)(-x_i)$$

$$\frac{\partial S}{\partial c} = 2 \sum_{i=1}^{N} (y_i - mx_i - c)(-1)$$

$$\frac{\partial S}{\partial c} = 0 \Rightarrow \sum_{i=1}^{N} x_i (y_i - mx_i - c) = 0$$

$$\frac{\partial S}{\partial c} = 0 \Rightarrow \sum_{i=1}^{N} (y_i - mx_i - c) = 0$$

$$\frac{\partial S}{\partial c} = 0 \Rightarrow \sum_{i=1}^{N} (y_i - mx_i - c) = 0$$

$$\frac{\partial S}{\partial c} = 0 \Rightarrow \sum_{i=1}^{N} (y_i - mx_i - c) = 0$$

$$\frac{\partial S}{\partial c} = 0 \Rightarrow \sum_{i=1}^{N} (y_i - mx_i - c) = 0$$

$$\frac{\partial S}{\partial c} = 0 \Rightarrow \sum_{i=1}^{N} (y_i - mx_i - c) = 0$$

$$\frac{\partial S}{\partial c} = 0 \Rightarrow \sum_{i=1}^{N} (y_i - mx_i - c) = 0$$

$$\frac{\partial S}{\partial c} = 0 \Rightarrow \sum_{i=1}^{N} (y_i - mx_i - c) = 0$$

$$\frac{\partial S}{\partial c} = 0 \Rightarrow \sum_{i=1}^{N} (y_i - mx_i - c) = 0$$

$$\frac{\partial S}{\partial c} = 0 \Rightarrow \sum_{i=1}^{N} (y_i - mx_i - c) = 0$$

Hence:
$$\sum_{i=1}^{N} x_i y_i - m \sum_{i=1}^{N} x_i^2 - c \sum_{i=1}^{N} x_i = 0 \quad \therefore \overline{xy} - m \overline{x^2} - c \overline{x} = 0$$
$$\sum_{i=1}^{N} y_i - m \sum_{i=1}^{N} x_i - c N = 0 \quad \therefore \overline{y} - m \overline{x} - c = 0$$

Therefore:
$$c = \overline{y} - m\overline{x}$$

 $\therefore \overline{xy} - m\overline{x^2} - (\overline{y} - m\overline{x})\overline{x} = 0$

$$\therefore m(\overline{x}^2 - \overline{x^2}) + \overline{xy} - \overline{yx} = 0$$

$$\therefore m = \frac{\overline{xy} - \overline{yx}}{\overline{x^2} - \overline{x}^2} = \frac{\text{cov}[x, y]}{V[x]}$$

If we repeat the analysis for the line: $x = My + d \Rightarrow M = \frac{\text{cov}[x, y]}{V[y]}$ If this was the *same line but rearranged*:

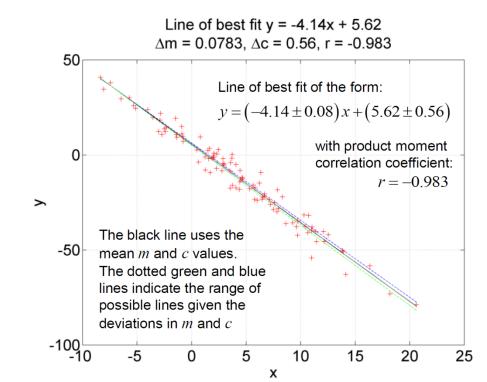

$$M = \frac{1}{m}$$
 : $mM = 1$

$$y = mx + c$$

Hence define a product moment correlation coefficient:

$$r = \frac{\text{cov}[x, y]}{\sqrt{V[x]V[y]}}$$

This will be +1 for a perfect positive correlation and -1 for a perfect negative correlation (i.e. S=0 in both cases).

It is possible to show* that the standard deviations (i.e. 'errors') in m and c are:

$$\Delta m = \frac{s}{\sqrt{N}} \frac{1}{\sqrt{V[x]}}$$

$$\Delta c = \frac{s}{\sqrt{N}} \sqrt{1 + \frac{\overline{x}^2}{V[x]}}$$

$$s = \sqrt{\frac{1}{N-2} \sum_{i=1}^{N} (y_i - mx_i - c)^2}$$

This is very useful in the physical sciences, as the errors in m and c will often be the uncertainties in model parameters (e.g. the strength of gravity...)

s is the *unbiased estimator* of the standard deviation in the y values from the line of best fit. The N-2 factor is due to two parameters (m and c) being used in the calculation, which are of course derived from the sample data themselves as shown above.

^{*}http://mathworld.wolfram.com/LeastSquaresFitting.html

In many situations a **direct proportion** is asserted between y and x. The computation of the line of best fit (which passes through (0,0) follows a similar argument to the one above.

$$S = \sum_{i=1}^{N} (y_i - mx_i)^2$$

$$\frac{\partial S}{\partial m} = 2\sum_{i=1}^{N} (y_i - mx_i)(-x_i)$$

$$\therefore \frac{\partial S}{\partial m} = 0 \Rightarrow \sum_{i=1}^{N} x_i (y_i - mx_i) = 0$$

$$\therefore \sum_{i=1}^{N} x_i y_i - m \sum_{i=1}^{N} x_i^2 = 0$$

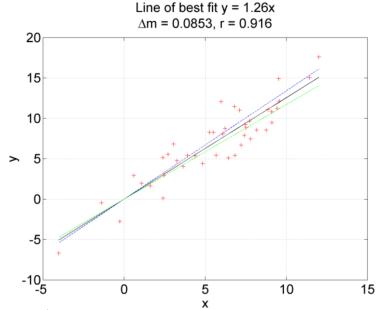

$$\therefore m = \frac{\overline{xy}}{\overline{x^2}}$$

The product moment correlation coefficient is the same as before but the standard deviation in m is slightly different since only *one* parameter is used in the computation of s (i.e. m).

$$\Delta m = \frac{s}{\sqrt{N}} \frac{1}{\sqrt{V[x]}}$$

$$s = \sqrt{\frac{1}{N-1} \sum_{i=1}^{N} (y_i - mx_i)^2}$$

$$r = \frac{\text{cov}[x, y]}{\sqrt{V[x]V[y]}}$$

Summary: Line of Best Fit for: y = mx + c

$$y = mx + c$$

$$\overline{x} = \frac{1}{N} \sum_{i=1}^{N} x_i, \quad y = \frac{1}{N} \sum_{i=1}^{N} y_i, \quad \overline{x^2} = \frac{1}{N} \sum_{i=1}^{N} x_i^2, \quad \overline{y^2} = \frac{1}{N} \sum_{i=1}^{N} y_i^2, \quad \overline{xy} = \frac{1}{N} \sum_{i=1}^{N} x_i y_i$$

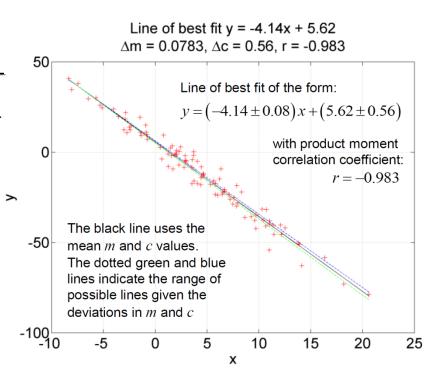

$$V[x] = \overline{x^2} - \overline{x}^2$$
, $V[y] = \overline{y^2} - \overline{y}$, $cov[x, y] = \overline{xy} - \overline{xy}$

$$m = \frac{xy - \overline{yx}}{\overline{x^2} - \overline{x}^2} = \frac{\text{cov}[x, y]}{V[x]}, \quad c = \overline{y} - m\overline{x}$$

$$r = \frac{\text{cov}[x, y]}{\sqrt{V[x]V[y]}}$$

$$\Delta m = \frac{s}{\sqrt{N}} \frac{1}{\sqrt{V[x]}}, \quad \Delta c = \frac{s}{\sqrt{N}} \sqrt{1 + \frac{\overline{x}^2}{V[x]}}$$

$$s = \sqrt{\frac{1}{N-2} \sum_{i=1}^{N} (y_i - mx_i - c)^2}$$

Summary: Line of Best Fit for:

$$y = mx$$

$$\overline{x} = \frac{1}{N} \sum_{i=1}^{N} x_i, \quad y = \frac{1}{N} \sum_{i=1}^{N} y_i, \quad \overline{x^2} = \frac{1}{N} \sum_{i=1}^{N} x_i^2, \quad \overline{y^2} = \frac{1}{N} \sum_{i=1}^{N} y_i^2, \quad \overline{xy} = \frac{1}{N} \sum_{i=1}^{N} x_i y_i$$

$$V[x] = \overline{x^2} - \overline{x}^2$$
, $V[y] = \overline{y^2} - \overline{y}$, $cov[x, y] = \overline{xy} - \overline{xy}$

$$m = \frac{xy}{x^2}$$

$$r = \frac{\text{cov}[x, y]}{\sqrt{V[x]V[y]}}$$

$$\Delta m = \frac{s}{\sqrt{N}} \frac{1}{\sqrt{V[x]}}$$

$$s = \sqrt{\frac{1}{N-1} \sum_{i=1}^{N} (y_i - mx_i)^2}$$
