

Morin, the Classical Mechanic

If strings, branes and quantum foams

Aren't easily digested

There is a book (it's coloured red)

That time is well invested

If balls and springs are more your thing

Your Physics inclination planar

Try sliding rings on inextensible things

And force yourself to be saner

Gravity acts in silent space

There's no torque but plenty of actions

Orbits are stable, elliptically

Since periods aren't rational fractions

Cease being fooled, try Lagrangian tools

If you are chained and under the cosh

It's Noether here nor there, if constraints are there

Don't despair, your equations will wash!

And if $\mathbf{r} \times \mathbf{p}$ isn't momentous for you

And your list of problems ain't topped

Feast your eyes on Relativity too

And dilate your pupils via clocks

And for those, who desire yet more

Go to unexpected lengths with vectors-four

In summary we all like this tome

It's even on my desk at home

For a Physics fix, no need to panic...

Try *Morin*, the Classical Mechanic
